Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                          SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Nouse sequences.
Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:338-3402) similarity (expect < 18-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                            QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Exports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1. .1989

Clone from S. Wiemann, Molecular Genome Analysis, German Cancer Research Center (DKFZ); Email s.wiemann@dkfz-heidelberg.de;
Requenced by Qiagen (Hilden/Germany) within the cDNA sequencing sequenced by Qiagen (Hilden/Germany) within the CDNA sequencing consortium of the German Genome Project.
This clone (DKFZp686G02190) is available at the RZPD in Berlin.
Please contact the RZPD: Ressourcenzentrum, Heubnerweg 6, 14059

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone ame. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality; > 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a MC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, SMBL; Sw., SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at the high sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping chromes man and an annother of the feature of an abbreviation of the Constructed by the Sanger Centre Chromosome 6 Mapping 28752 ô Submitted (06-JUM-2003) Wellcome Trust Sanger Institute, Hinxton, cambridgeshire, CB10 1SA, UK. Gene therapy, emphysema; ss; gene; chronic obstructive pulmonary disease; respiratory disorder; lung cancer; asthma; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a combination comprising cDNAs or their complements that are differentially expressed in respiratory disorder. The combination is useful for preparing a composition for diagnosing or treating respiratory disorders e.g. lung cancer, chronic obstructive pulmonary disease, emphysema or asthma. The present sequence represents human cDNA differentially expressed during lung cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New combination comprising cDNAs that are differentially expressed in respiratory disorders, useful for diagnosing or treating respiratory disorders e.g., lung cancer, chronic obstructive pulmonary disease, emphysema or asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         BP; 1438 A; 1424 C; 1483 G; 1351 T; 0 U; 0 Other;

The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for antineoplastic activity, determining a change in comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used for anti-neoplastic activity. (I) has cytostatic anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as a colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidhey, prostate or pancreatic cancer, adenocarcinoma, calear cell cancer, infiltrating lobular cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's

                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                  The invention relates to a gene expression profile comprising one or more CC genes (ABZ34889-ABZ35652) and generated from a cell type. The cell type is a coronary artery endothelium, umbilical artery or vein endothelium, contic endothelium, dermal microvascular endothelium, pulmonary artery conditions are reported in the contice endothelium, dermal microvascular endothelium, keratinocyte epithelium, bronchial epithelium, renad proximal tubule epithelium, small airway epithelium, renal epithelium, renal proximal tubule epithelium, small airway epithelium, renal epithelium, umbilical artery smooth small airway epithelium, renal epithelium, umbilical artery smooth muscle, meonatal dermal fibroblast, pulmonary artery smooth muscle, coronary artery smooth muscle, meonath muscle, mesangial cells, coronary artery smooth muscle, coronary artery smooth muscle, coronary artery smooth muscle, dermal fibroblast, or prostate stromal cell. The gene expression profile is used for determining the level of RNA expression for a sample, determining the phenotype of a cell and distinguishing cell types. The gene or a prottein expression profile is useful in identifying disease pathologies involving alterations of gene expression. The assessment of expression profiles may provide meaningful information with respect to tumour type and stage, coronary also be used for creating microarray. The microarray is useful for genetic and physical mapping of genomes, DNA sequencing, genetic or medical diagnosis, genotyping of organisms, confirming cell or tissue confirming and in identifying promising antibiotics, antiviral or antiviral or antiviral or identifications and in identifying promising antibiotics, antiviral or antiping antibiotics.
